PRD Template for AI Products

Week1

{Title}

1. PROBLEM DEFINITION

What problem is this solving?

{Briefly describe what is the problem, what is the job - to - be done, }

Who are you solving this problem for?

{Who are your ideal customer persona, your target market}

Why is this problem worth solving?

{Make a case, cite data proving why this problem needs to be solved. Consider your MOAT here. What will your solution provide that is better than other options or Claude/Co-Work or copilots}

Why Agentic AI?

{Explain why use of ML or LLMs with tools, planing are better suited to solve this problem vs traditional rule based system of just ML models as is}

How will you know that the problem is solved?

{Set a specific goal and metric that you want to measure}

Add North Start Metrics, Primary and Secondary metrics

2.SOLUTION DEFINITION

User Flows

{Add flow diagram here showing how you visualize the product working, what is the input, what is the expected output etc, Ensure that AI drawbacks like hallucination, explainability are addressed}

Functional Requirements

{List required features and required behaviour, user stories }

Week 2

3.PRIORITIZATION

Breaking your Agentic workflow into components

{List different components of your AI Agent in a flow diagram}

Identify risks at each component level and in overall agentic workflow

{Perform risk assessment for each of the components, use below table as guide and add more checks if needed}

Component : Extract Key Terms from Contract		
Check	Why do this	Results
Is ML necessary?	As discussed in the earlier lesson on rule-based systems, considering the cost-effectiveness and ease of	PASS Rule-based systems won't be a good solution

Component : Extract Key Terms from Contract

	implementation, determine whether ML is a better approach. Further, this cross functional team first questions so having this figured out is important.	because each contract is different and rule-based systems will not be able to extract the key terms from contracts with high precision. ML can be a good solution given the contract and any of its changes as be fed into a model that uses natural language processing.
Do you have data to train?		
Can it be solved by ML/AI?		
Can it meet the customer accuracy requirements?		
Can it scale?		
How fast can you get feedback?		
What are the laws?		
What about bias?		
How transparent/explainable can you be?		
How easy is it to		

Component : Extract Key Terms from Contract		
judge good vs bad response or “judge” ?		

Sample analysis summary, across all the components

Once we are done with component level risk we can identify all risks in your AI agents workflow.

Component	Risk	Comment
E-mail integration	low	We have already seen existing tools like Microsoft power automate that can help here.
Convert contract to text		
Checking contract type		
Create rule/playbook		
Extract key terms from contract		
FInd risk based on playbook		

Prioritize components and narrow scope

{Follow the prioritization tenants listed in the lesson ‘Product Roadmap & Prioritization’ and list prioritized stories}

4.ROADMAP

{define the roadmap for your MVP as described in lesson ‘Product Roadmap & Prioritization’ }

Releases	Features	Duration
MVP		
MVP 1		
Launch		

Iteration		
-----------	--	--

WEEK 3

5.IMPLEMENTATION PLAN

Evaluation Strategy (Evaluating AI / Writing Evals)

{List plan for setting up evaluation for this product, how will you establish ground truth, plan to evaluate, Add how AI performance will be monitored and measured over time}

Model Requirements

{Add Model selection criteria and requirements below}

Here is an example to get you started...

CRITERIA	REQUIREMENT RATIONALE	
Open vs. Closed Source	Closed Source	“We do not have the resources to use an open-sourced model.”
Context Window	128K+	“We need to pass in a large volume of data into the prompt.”
Modalities	Text, Vision	“We want users to be able to upload images and converse with them.”
Fine-Tuning Capability	Required	“We will fine-tune our own model with proprietary data.”

CRITERIA	REQUIREMENT RATIONALE	
Latency	High Priority	“Given the real-time nature of the product, speed is incredibly important. We are willing to spend more for a faster model as we believe it will lend itself to a positive ROI.”
Accuracy	High Priority	“Given the nature of regulatory requirements, accuracy is important”
Parameters	N/A	“Given we are using GPT-4, that model only comes in 1 parameter size (1.7T). We considered using a smaller model and fine-tuning it, but given that we want our model to have broad general knowledge, we’ve decided against it.”
Time to Market	Medium	Based on current plan we want to go to market in 3 months

6. EVALUATIONS

{Add your evaluations based on the HHH framework}

Make a copy of this sheet for your project, Edit it and Add a link to your Evals to your PRD
<https://docs.google.com/spreadsheets/d/1j82be2ibJ7Inf2ONGNeqf0LxBVitZvI2XmiFjCmH44A/edit?usp=sharing>

Launch Plan

{What experimentation will you setup for the product, what evaluation criteria must be met for a Go live decision}

Example - Table : Launch Criteria

Launch	Helpful	Honest	Harmless	Reason
Measurement launch (1-2%)				
Beta launch (2-10%)				
Launch				

WEEK 4

7. DATA REQUIREMENTS

{List the data strategy for your product}

Model Fine-Tuning

Are you fine tuning the model, if yes explain why (eg. tone/style, functional output, specialized knowledge)

Data Preparation

Is this data used for model turning or evaluation (establishing ground truth)
Describe your process to collect/generate and prepare the data

Data Quantity

Describe how much data you require (eg. 100 contracts).

Iterative Data Collection

Describe your methodology to collect data on an ongoing basis

Iterative Fine-Tuning

Describe your methodology to continuously fine-tune the model, if applicable.

Knowledge Base

Describe what type of data (docs, spreadsheets) you will use for RAG Knowledge base.

Prompt Strategy

{Add details around what type of prompting techniques you will use for this product}

8. RESPONSIBLE AI RISKS & MITIGATION

{Add your assessment on what responsible AI risks face your product and how you will mitigate them}

Q: How are we ensuring that we are not showing up in the media on the wrong side of AI (Responsible AI)?

For Responsible AI:

Accountability ::To ensure that your ML system is designed with a positive impact on people, organizations, and society, start by assessing its potential impact during the design or requirement-gathering stage of your product and follow these steps.

What are the efficacy and limitations of your product?	
--	--

What compliance and Policies apply to manage sensitive data?	
--	--

How will you Manage sensitive data?	
-------------------------------------	--

Human oversight and control ?	
-------------------------------	--

Transparency:Transparent systems ensure that all stakeholders, including those who use the system to make decisions and those who are impacted by those decisions, can understand how the system is designed, how it functions, and how it can be modified

What are the direct and indirect use cases of your solution?	
--	--

How do you come up with results, what is considered on each step?	
---	--

What benchmarks like accuracy, precision do you need to share?	
--	--

What disclosure will we need here?	
Fairness : To ensure that your ML/AI systems provide a similar quality of service for all identified areas of operation, including marginalized groups, here are some practical questions to come up with your own policy.	
What groups will be underrepresented , i.e your product will not work for these specific groups?How will you close this gap?(identify minimum data needed and collection plan)	
Explain why certain groups don't work with your product ?	
What test/feedback loop will you put to identify groups that are not working well in your product?How will you address these?	
Reliability and safety:To ensure that your ML/AI features consistently produce reliable and safe results, we need to proactively identify and address any safety-related issues and be transparent with our users about any vulnerabilities. Here are some practical question that will help you to implement this in the product development lifecycle:	
what a reliable and safe product experience entails, what are acceptable error rates?	
What are the consequences of inputting data into your system? What can go wrong here?	
What is the recovery plan in case the system is not working as intended?	
How do you plan to moderate the usage of the system and monitor the health of the system?In case things go wrong, how do you plan to communicate to your customers?	

WEEK 5

9.PRICING

Costs & Accuracy Tradeoffs (Optional)

{List different cost and accuracy tradeoffs you had to make during development}

S. No	Item	What We Used	Why We Chose This	Trade-Offs
1	Framework			
2	LLM for Inference			
3	Libraries/Tools			
4	User Interface			
5	Vector Database			
6	Hosting App Builds on Private Repository			
7	Dev Editor			

Development Costs

{List 1time cost of building this product - Infrastructure and Manpower }

S NO	ITEM	COST
1	Azure VM T4-16GB Nvidia GPU	
2	Azure Open AI GPT-3.5-Turbo-0125 16K (Output)	
3	Azure Open AI GPT-3.5-Turbo-0125 16K (Input)	
4	Azure Open AI GPT-4-Turbo 128K (Input)	

5	Azure Open AI GPT-4-Turbo 128K (Output)	
6	Google Cloud Vision API	
7	Azure App Service (P0v3) Premium Plan (4GB RAM, 250 GB Storage)	
8	Azure Storage Table (GB/month)	
9	Azure Blob Storage (First 50 terabyte (TB) / month)	
10	Docker Hub	
11	Github (4 users)	
12	Hosting (DNS)	

Resource (Manpower cost)

S NO	ITEM	COST
1	Dev Ops Engineer	
2	Front End Engineer	
3	Backend Engineer (x2)	
TOTAL		

Operational Costs

{List ongoing costs to run the product - Infrastructure and Manpower }

Market Size

{List Total Addressable Market (TAM), Serviceable Addressable Market(SAM)}

Revenue Potential

{List different revenue scenarios for this product}

Pricing Models

{List different pricing models and give rationale which one is used for this product}

Directional Pricing

{What is the directional pricing for this feature}
